Task 4 - Accessibility, Performance and Review for Layout with Text + Image

1. Review Table

This table identifies technical and usability gaps in the initial Task 3 plan.

Element	Potential Issue	Proposed Fix	Priority
Hero Image	Original file might be too large, causing slow load times	Compress to WebP format, target 1080 x 720 px, and place in drawable-nodpi	High
Description Text	14 sp might be too small for users with visual impairments	Increase body text size to 16 sp for better legibility	Medium
Product Image	Missing contentDescription, making it invisible to screen readers	Add a descriptive contentDescription string (for example "Wireless noise-canceling headphones")	High
Buy Button	Touch target might be smaller than recommended 48 dp	Set minimum height and width of the button to 48 dp to ensure easy tapping	High

2. Mini-Action Plan

Concrete Changes Before Coding

1. Optimize Assets
   Run the product hero image through a compressor to ensure it is under 200 KB.
2. Accessibility Update
   Map out specific contentDescription strings for all images and icons.
3. Responsive Check
   Adjust the layout to use a scrollable Column so text does not get cut off on small screens.

Schedule

Before Coding

- Asset compression
- Font size finalization
- Accessibility labeling

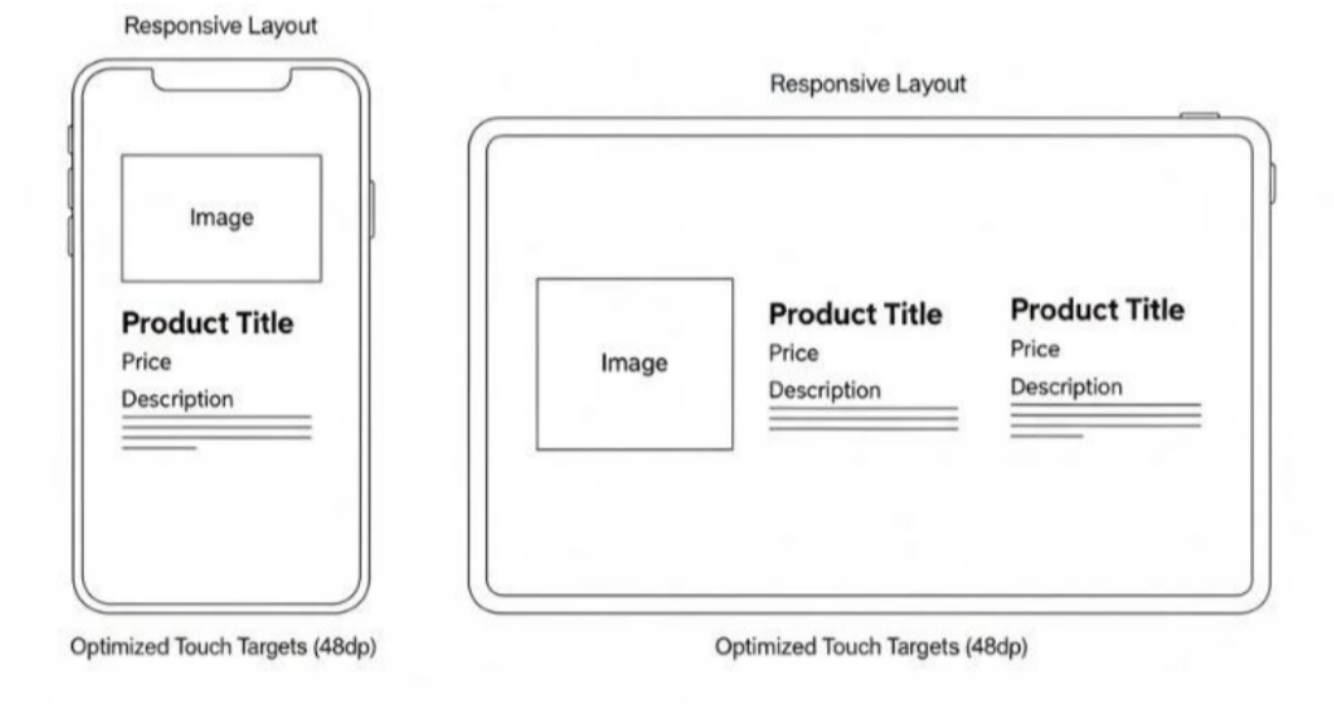
During Coding

- Implement Modifier.sizeIn(minHeight = 48.dp) for buttons
- Test layout responsiveness in Previewer

After Testing

- Fine-tune color contrast based on real-device feedback

Visual Reference: Responsive Layout and Accessibility



3. Reflection: Early Planning Benefits

Planning for accessibility and performance early ensures that the app is inclusive and efficient from the first line of code.

It prevents costly rework later such as resizing many images or redesigning layouts that do not scale.

This proactive approach leads to a higher-quality product and provides a better experience for all users regardless of device or physical abilities.
