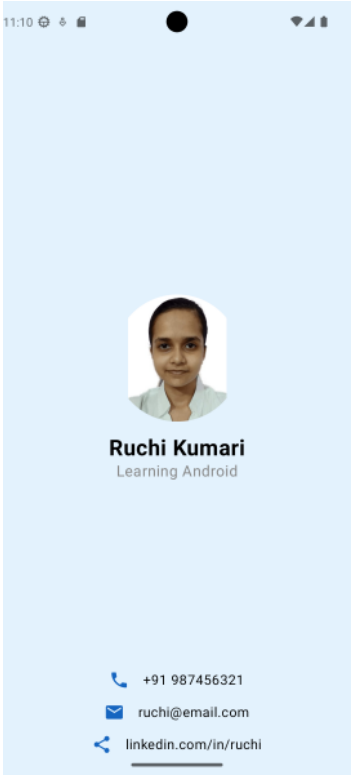
Task 3 - Layout Review and Improvement Plan of Your Business Card

1. Multi-Device Layout Analysis

Mobile Portrait (Final Implementation)

The light-theme creates a clean, modern developer profile.

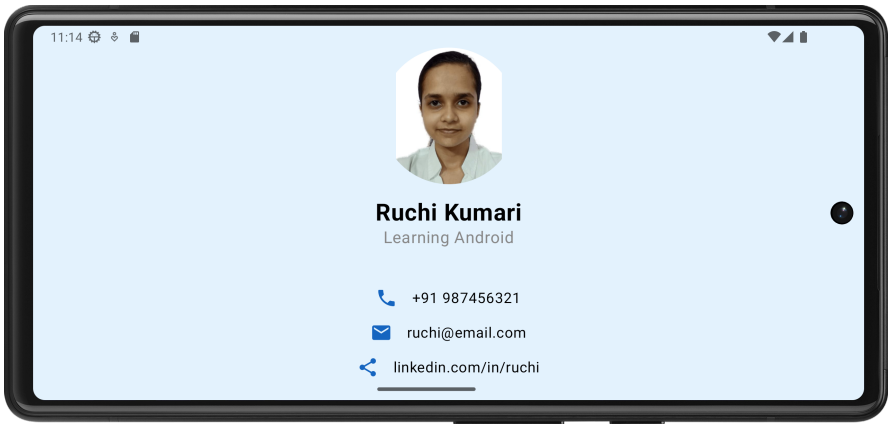
The content is grouped vertically with a visual divider to separate the bio from contact information.



Tablet or Large Screen (Final Implementation)

The layout maintains its integrity on larger screens.

By using Arrangement.Center and wrapContentWidth() for the contact block, the information remains centered and readable without stretching across the wide display.



2. UI Review Checklist

I evaluated the final implementation based on the required criteria:

Visual Alignment and Spacing

My initial design had significant dead space.

The final version uses centered arrangement and a horizontal Divider to create a balanced layout.

Readability

Contrast was a concern in the light-themed prototype.

The final version uses:

- White text
- Android Green text
- Deep navy background (#073042)

This makes the content easy to read.

Resource Usage

The profile image is stored in drawable-nodpi.

This ensures clear resolution across different screen densities without using excessive memory.

Responsiveness

The layout adapts properly to both mobile and tablet orientations.

Center alignment ensures elements do not spread too far apart on larger screens.

Accessibility and Usability

All contact rows use:

heightIn(min = 48.dp)

This ensures proper touch targets.

All icons include contentDescription.

3. Improvement Plan Table

Issue Found	Proposed Fix	Priority
Low Contrast Aesthetic	Updated to a light theme using Background (#E3F2FD), Accent Blue (#0000FF), and Black text (#000000) to improve clarity and readability	High
Disconnected Layout	Changed Arrangement.SpaceBetween to Arrangement.Center and introduced a Divider for better visual structure	Medium
Small Touch Targets	Implemented minimum 48.dp height for ContactRow elements to meet accessibility standards	High

4. Reflection

This evaluation process showed that a UI is not complete until it is tested on multiple device sizes.

Reviewing the initial prototype helped identify problems such as empty space and weak layout structure.

Using better colors and accessibility improvements resulted in a design that is both attractive and functional.

In future Compose projects, I will evaluate accessibility and layout hierarchy during the preview stage instead of waiting until the end.
